IOWA POPULATION PROJECTIONS

Methodology and Assumptions

July 1984

The population projections were prepared using a cohort-component method. Iowa's population was divided into five-year age groups, and each person in the group is a cohort. For example, everyone aged 15 to 19 was in one group, 20 to 24 in another group, and so on. Then projections for each age group were made based on rates of the three components that influence population change: births, deaths and net migration (people moving into an area minus people moving out).

The base population of April 1, 1980, was carried forward period-by-period using projected survival rates and net migration by five-year age groups and by sex. Each period, a new cohort of persons under the age of one year was added to the population by applying projected age-specific fertility rates to the surviving female population. The population of each county was projected separately and then adjusted to the independently projected state total.

Fertility was assumed to reach a completed average of 1.9 births per woman. This is consistent with recent levels of fertility, women's expectations of future births, and social and economic trends (e.g. increased labor force participation, educational attainment and age at first marriage) leading to lower fertility. Age-specific fertility rates were calculated for the state and each county, then adjusted to the Census Bureau's Series III white female projected rates.

Mortality was projected to decline over the twenty-year period. Iowa sex-specific life tables were developed by averaging the number of deaths for the years 1979 through 1981, and balancing this figure against projected U.S. survival rates. Life expectancy for males is assumed to increase from 72.1 years of age in 1980 to 74.8 by 2000. Females will rise from 79.9 years in 1980 to 83.0 by 2000.

Sex-age-specific net migration rates were adjusted, for the state and counties, to the level published in Current Population Reports, Series P-26, No. 82-19-C. Migration was assumed to continue at a declining rate stabilizing in the early 21st century.
